The teacher of Specialized Fergana School

**Annotation.** The article discusses the importance of modern methods in using the heritage of ancestors through the science of education in primary grades.

**Key words:** successful life, the concept of science, methodical perfection, educational process, concrete reality.

On the initiative of the President of the Republic of Uzbekistan, the subject of education was introduced in general secondary educational institutions from the 2020-2021 academic year. This subject, as part of the concept of continuous spiritual education, inculcates in students the idea of “From national revival to national rise”, prepares them for a socially successful life, active citizenship, responsibility, commitment, legal awareness and culture, a deep worldview, aimed at forming qualities such as healthy faith, enlightenment, and tolerance. The experience of foreign countries such as Japan, Singapore, England, UAE, China, Korea, Russia, and Germany was used to create the concept of science and textbooks. Since the educational process is an extremely complex process, the effectiveness of education depends on the activity of the pedagogue and the student, the availability of educational tools, and the organizational, scientific, and methodical perfection of the educational process.

It is a system of improving the educational process based on advanced tools, methods, technical means and methods. This system is created by the teacher, serves to connect educational stages. It includes predetermining its content and tasks, purpose, preparation of forms and means of education, planning of lessons aimed at assimilation of spiritual qualities intended to be formed in the student.

Today, with the development of science and technology, human activity has expanded tremendously, and new technologies are entering. Quality changes indicate that there are now new technical, informational, audiovisual tools that require new methods and are becoming an integral part of the educational process, introducing its own characteristics, which are modern pedagogical tools. Made technologies a concrete reality.

It increases the productivity of the educational process, forms students' independent thinking process, increases students' enthusiasm and interest in knowledge, develops the skills and competencies of solid mastering of knowledge, free use of it in practice. The traditional teaching system can be described as informative teaching due to the fact that it relies on written and spoken words, because the teacher's activity is not only as an organizer of the learning

process, but also as an authority. is being evaluated, noting that it is becoming a source of knowledge.

The Uzbek people have many centuries of methods and tools, forms of events, unique customs and traditions, ideas about education and life experience that have been used for preparing the young generation for life. This heritage has been the basis for the development of many scholars and sages in the past.

Nowadays, the creative use of this heritage is of great importance. Our ancestors attached great importance to the activity of a teacher who teaches knowledge. This was one of the main requirements for pedagogical activity.

The great thinker of the Eastern Renaissance, Abu Nasr Farabi, says this about intelligent, wise and sharp-thinking people: has a great talent for invention; they keep themselves away from bad deeds. Such people are called intelligent. In his opinion, "Education is only through words and teaching. And education is learning through practical work and experience, that is, being given to the work, profession, which consists of the practical skills of this people, this nation. If they are given to work, profession, if they are interested in profession, if this interest completely attracts them to profession, then they will be true lovers of profession."

The educational process includes two interrelated activities - the activity of the teacher and the student. In the process of education, the student's mind is formed, his feelings and various abilities are developed, his ideological, moral, volitional, aesthetic qualities are formed, the system of scientific views on nature and society is formed, and his physical strength is strengthened. In the process of education, moral skills and habits are formed in the student in accordance with the moral requirements of the society. To achieve this, the student's mind (in the educational process), emotions (in the lesson and in various extracurricular activities), and will (in the process of organizing activities, managing behavior) are systematically and systematically influenced. feeling, will) is neglected, it becomes difficult to achieve the goal.

The essence and tasks of the educational process aimed at a certain goal are planned and regulated by the educator.

A) It is planned in order to form or lose what character of the student.

B) Resources are sought to cultivate or eliminate these feelings.

V) Which and where to use the theoretical and practical resources that serve the specified purpose.

The technology of using the script "Business game" in teaching education

The purpose of education is formed according to the needs of society. Therefore, the goal of education should be appropriate and proportionate. The goal of education in scientific literature is to create skills and competencies, develop logical-creative thinking, improve communicative literacy, inculcate the national idea, form oriental education, define personality. it is emphasized that it consists of spiritual enrichment. Based on the educational goal, students' communication culture is improved by increasing their independent thinking, oral and written literacy, and developing logical thinking.

On the basis of the educational goal, spiritual, ideological and sophisticated education is provided. In the process of language learning, there is an opportunity to get closer to the cultural and moral values of the people. It is known that the implementation of advanced pedagogy and new information technologies in education not only increases the effectiveness of training sessions, but also in the education of an independent and logically thinking, well-rounded and highly moral person by applying the achievements of science in practice is important.

Today, the interest in using interactive methods and information technologies in the educational process is increasing day by day. One of the reasons for this is that until now, in traditional education, students were taught only to acquire ready-made knowledge, and the use of modern technologies allows them to search for the knowledge they acquire, independent study and thinking, analysis. Even teaches them to draw their own conclusions. In this process, the teacher creates conditions for personal development, formation, learning and upbringing, and at the same time performs the functions of management and direction.

The use of interactive methods and educational games, modern information and communication technologies in primary grades helps students to think independently, expand the scope of creative research and logical thinking, connect what they learned in classes with life, and increase their interest. Effective use of the conditions created by teachers based on such modern requirements and organization of classes based on advanced pedagogical and information communication technologies guarantees the quality of the educational process.

In conclusion, in our opinion, the main requirements for educational games are as follows:

1. Educational games should be suitable for the age of students;
2. The games should be proportionate to the content of the topic;
3. The time of educational games must be clearly defined;
4. Educational games should have both educational and educational value;
5. The purpose and significance of educational games should be determined.
